CBD Ventures

Database Testing, Data Management & Backup

1. Scope and environment

Primary test schema: cbdventures_db_clean. Independent restoration schema: cbdventures_db_restore_test. Testing covered baseline structure/data, installation and behavior of six triggers, backup export, and restoration verification. Tests involving temporary changes were rolled back; the final event query returned 0 rows and the final review query returned 0 rows.

2. Verified test results

ID	Test	Expected	Observed result	Status
01	Base table count	12	12	PASS
02	Baseline records	39	39	PASS
03	Installed triggers	6	6	PASS
04	Business INSERT location	Reject >1 km	Error 1644: within 1 km of Richfield Pretoria Campus	PASS
05	Event INSERT date	Reject past date	Error 1644: event start date/time must be future	PASS
06	Owner self-review	Reject owner review	Error 1644: owners cannot review own business; owner restored to NULL	PASS
07	Review within 24 hours	Reject second review	Error 1644 on second review; rollback verified 0 reviews	PASS*
08	Business UPDATE location	Reject >1 km	Error 1644: within 1 km of Richfield Pretoria Campus	PASS
09	Event UPDATE date	Reject past upcoming event	Error 1644: upcoming event must have future start date/time; rollback 0 rows	PASS
10	Database backup export	Export completes	MySQL Workbench: Export Completed	PASS
11	Restore verification	12 tables, 39 records, 6 triggers	12 tables, 39 records, 6 triggers	PASS

*24-hour test: the user provided the second INSERT error and confirmed the rollback left 0 reviews. The first INSERT success line was not separately supplied in the conversation; review the Workbench Action Output before treating the two-step sequence as fully documented.

3. Backup and restoration procedure

A self-contained MySQL Workbench export was created with structure and data, schema creation, and triggers. The backup was copied to CBDventures_Restore_Test.sql, and schema references were changed from cbdventures_db_clean to cbdventures_db_restore_test before executing the restore script. The restored

schema was queried independently: 12 base tables, 6 triggers, and 39 records. The original backup should be retained unchanged.

4. Screenshot evidence

Screenshots below are from the testing session. Some results were supplied as copied Workbench Action Output text rather than screenshots; the exact error messages are recorded in Section 2. Additional full-window screenshots may be added before group submission.

Installed triggers — six trigger definitions

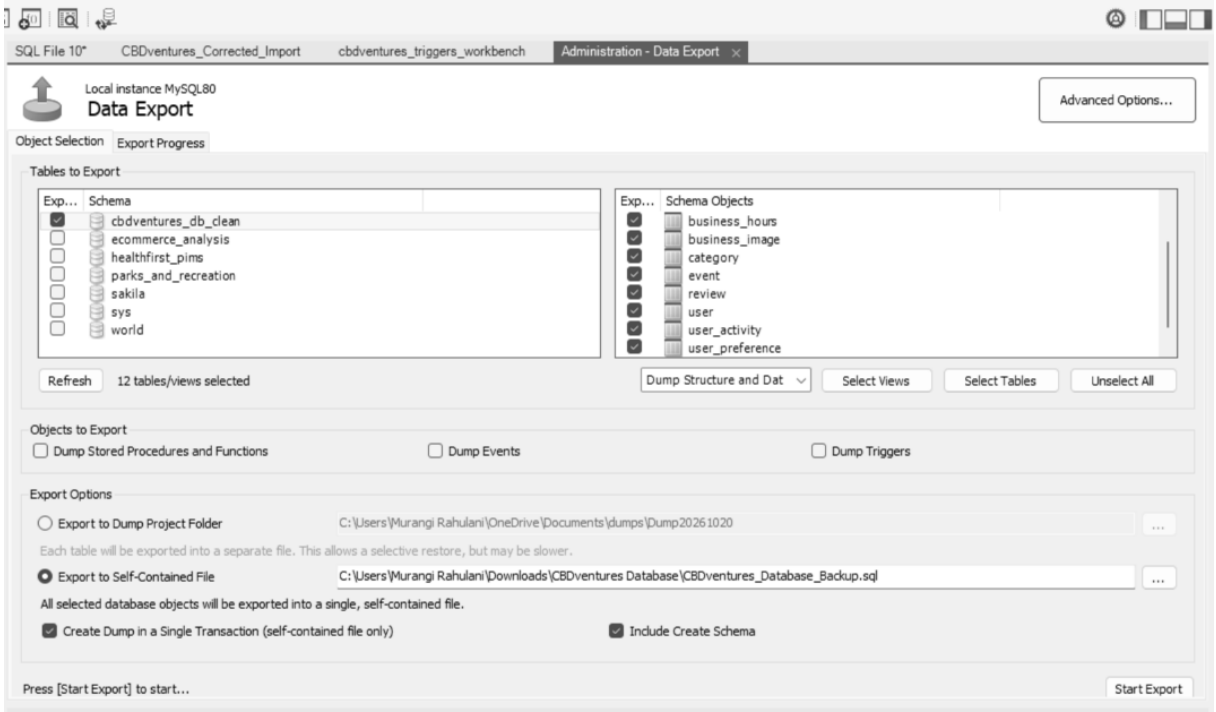

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

TRIGGER_NAME	EVENT_MANIPULATION	EVENT_OBJECT_TABLE
trg_business_within_1km_insert	INSERT	business
trg_business_within_1km_update	UPDATE	business
trg_event_future_insert	INSERT	event
trg_event_future_update	UPDATE	event
trg_review_no_self_review	INSERT	review
trg_review_24h_limit	INSERT	review

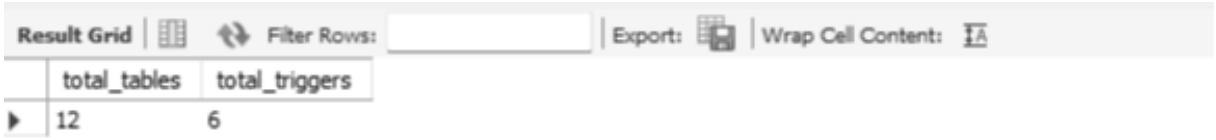

Business INSERT validation — error 1644

✓	311	08:21:30	USE cbdventures_db_clean	0 row(s) affected	0.000 sec
✗	312	08:21:30	INSERT INTO business (name, address, latitude, longitude) VALUES ('TEST Invali...	Error Code: 1644. Business location must be within 1 km of Richfield Pretoria Campus.	0.015 sec

Backup export configuration

Restored schema verification — 12 tables and 6 triggers

5. Conclusion

The confirmed baseline contains 12 tables and 39 records, with six installed triggers. Invalid business locations, past event dates, and self-reviews were rejected as intended. A self-contained backup was exported and restored to a separate schema, where 12 tables, 39 records, and 6 triggers were confirmed. The group should retain the original exported SQL backup and use the accompanying Database_Tests.sql to repeat the checks if needed.
